CZECH TECHNICAL UNIVERSITY IN PRAGUE
FACULTY OF INFORMATION TECHNOLOGY
DEPARTMENT OF THEORETICAL COMPUTER SCIENCE

Master's thesis

**Admission procedure
Automatic processing of applications
for master's study program**

Bc. Ján Ondrušek

Supervisor: Ing. Tomáš Kadlec

6th June 2012

Acknowledgements

I would like to thank my family and friends for support during writing this thesis.

Declaration

I hereby declare that I have completed this thesis independently and that I have listed all the literature and publications used.

I have no objection to usage of this work in compliance with the act 60 no. 121/2000 (copyright law), and with the rights connected with the copyright act included the changes in the act.

Citation of this thesis

Ján Ondrušek. *Admission procedure*
Automatic processing of applications
for master's study program: Master's thesis. Czech Republic: Czech Technical University in Prague, Faculty of Information Technology, 2012.

Abstract

Primary aim of this thesis is to analyse Conditions for admission and Dean's directive for admission process to master's study programme at CTU FIT. Implement RESTful API, which exposes backend functionality for admission processing using Business Process Management.

Keywords Admission procedure, RESTful API, BPM, jBPM, Spring, Spring Roo

Abstrakt

Primárnym cieľom tejto diplomovej práce je analyzovať Řád přijímacího řízení ČVUT a Směrnici děkana pro přijímací řízení na ČVUT Fakultě informačních technologií. Implementovat RESTful API, ktoré vystaví funkcionality backendu pre přijímací proces s použitím Business Process Management stroja.

Klíčová slova Spracovanie prihlášok, RESTful API, BPM, jBPM, Spring, Spring Roo

Prologue

Motivation and objectives

Every year, hundreds of high school graduates apply for studies at Czech Technical University, Faculty of Informatics. This raises certain requirements, including managing, storing, analysing and processing of all these applications. Each application has its own life cycle, which begins with filling out an on-line form and continues through various steps which an applicant has to pass. The life cycle ends when a decision of acceptance is delivered to the applicant and he either enrolls in the studies or not.

We live in the world of new era of the Internet. Everything goes on-line, web and the latest trend - everything goes mobile. People want things to happen very quickly. They want to access all the information fast, now.

Students and applicants are no different. They expect from this prestigious University, especially from Faculty of Informatics, the most modern and useful gadgets when it comes to software and web.

How do things work now

Currently all applications are processed rather manually. Many man days of administrative work are consumed during the process. Although an electronic form is filled in and submitted by an applicant, the rest of actions almost exclusively fall into the hands of Study Department staff. Some of the work is handled by simple scripts or other utilities. The question is: Why don't we do most of the work automatically?

This work is monotonous and can even lead to men's frustration.

What should be achieved - the goals

Courses at Faculty of informatics teach its students to handle various programming languages, web technologies and techniques. We all know what to expect from a working web application and good looking one is a bonus. This is why knowledge of faculty's students should be used for good of their suc-

cessors. Fast, reliable, informative and functional system will make them feel more comfortable and perhaps could even save some precious time.

Ideal state would be to accept on-line application and automatically generate invitations for applicants, that should attend a test. After the test, process all results and generate decision of acceptance letter for all who passed the test or are accepted without it. The only manual interventions that will remain is to accept apology, appeal and insert the letters into the envelopes.

Pragmatically goals of this thesis could be summarized as follows:

- familiarise with RESTful best practices, patterns and anti-patterns
- familiarise with BPM with main focus on jBPM
- implement RESTful Application Programming Interface (API) (backend) according to functionality requested by Android and Web UI teams
- implement admission processing using Java and jBPM processing machine
- explore new and modern Java (JEE) technologies
- follow modern development methodologies
- perform tests during and after development
- use exclusively Open Source software and tools

Let's make things better

Taking the above written into account, this might be a good idea for a master's or bachelor's thesis. However if we want to use all available technologies that have become popular in past years and automatize the majority of admission processing, it turns out to be a very complex project. So why not to create several teams and split necessary work into multiple, both bachelor's and master's, thesis?

This is how project Příříz was born. It includes web interface for both students and Study Department staff, native Android application and RESTful API with BPM processing machine, which is the subject of my master's thesis.

Structure of this work

Basically, I could divide my work into these main parts, which are then further split into chapters:

- Theoretical introduction

- Analytical part
- Implementation and unit testing
- Integration and regression testing
- Results and conclusion

Appendices at the end of the document are referred directly from the text within the chapters. Smaller figures, tables or other objects are put directly into the content.

RESTful API with JAX-RS

Nowadays, Internet consumers demand fast growth of various services and integration of their favourite ones. As an example I can point out synchronization of contact list between very popular social networks, e-mail providers and phone contact lists.

Other example may be growing amount of **mashups**¹ and uncountable number of **startups**², who often provide RESTful or different type of public API.

¹Applications that are created via combination of multiple different services. Such application, almost exclusively web based, can be created very quickly by consuming several APIs. Not necessarily from the same provider.

²Constantly rising amount of web applications, that focus on fast growth of attracted users. They offer various services, which are often very innovative and experimental. One successful example is popular social network and my favorite information channel - Twitter.

CHAPTER 2

BPM and jBPM

CHAPTER 3

Discussion about technologies
